CLAIMS

What is claimed is:

- 1. A circuit for reducing east-west geometry mismatch between the top and bottom of a raster display, the circuit comprising:
 - a first signal generator operable to generate a first signal having a parabolic portion;
 - a second signal generator operable to generate a second signal having a parabolic portion; and
 - a signal combiner operable to generate a third signal by combining the first signal and the second signal so that the parabolic portion of the first signal is continuous with the parabolic portion of the second signal.
- 2. The circuit of Claim 1 further comprising a horizontal deflection coil operable to receive the third signal.
 - 3. The circuit of Claim 1 wherein the first signal generator comprises:
 - a sawtooth generator operable to generate a sawtooth signal; one or more multipliers operable to generate one or more higher-order signals from the sawtooth signal; and
 - a signal combiner operable to combine one or more of the higher-order signals to generate the first signal.
 - 4. The circuit of Claim 1 wherein the second signal generator comprises:

M-11723 US 804312 vI

> a sawtooth generator operable to generate a sawtooth signal; one or more multipliers operable to generate one or more higher-order signals from the sawtooth signal; and

> a signal combiner operable to combine one or more of the higher-order signals to generate the second signal.

- 5. The circuit of Claim 1 wherein the second signal generator includes a level shifter.
- 6. The circuit of Claim 1 wherein the second signal generator includes an inverter.
- 7. The circuit of Claim 1 wherein the second signal generator includes a gain controller.
- 8. The circuit of Claim 1 wherein the circuit is implemented on a single integrated circuit device.
- 9. A method for reducing east-west geometry mismatch between the top and bottom of a raster display, the method comprising generating a third signal by combining a first signal having a parabolic portion with a second signal having a parabolic portion so that the parabolic portion of the first signal is continuous with the parabolic portion of the second signal.
- 10. The method of Claim 9 further comprising providing the third signal to a horizontal deflection coil.

- 11. The method of Claim 9 further comprising generating the first signal.
- 12. The method of Claim 11 wherein generating the first signal comprises: generating a sawtooth signal;

generating one or more higher-order signals from the sawtooth signal; and using one or more of the higher-order signals to generate the first signal.

- 13. The method of Claim 9 further comprising generating the second signal.
- 14. The method of Claim 13 wherein generating the second signal comprises:

generating a sawtooth signal;

generating one or more higher-order signals from the sawtooth signal; and

using one or more of the higher-order signals to generate the second signal.

- 13. The method of Claim 9 further comprising shifting the level of the second signal.
 - 14. The method of Claim 9 further comprising inverting the second signal.

- 15. The method of Claim 9 further comprising increasing or decreasing the amplitude of the second signal.
- 16. The method of Claim 9 wherein the method is performed on a single integrated circuit.
- 17. A circuit for reducing east-west geometry mismatch between the top and bottom of a raster display, the circuit comprising:
 - a first signal generator operable to generate a first horizontal correction signal component having a parabolic portion;
 - a second signal generator operable to generate a second horizontal correction signal component having a parabolic portion;

a signal combiner operable to generate a horizontal correction signal by combining the first horizontal correction signal component and the second horizontal correction signal component such that the horizontal correction signal is a continuous signal; and

an amplifier operable to amplify the horizontal correction signal, wherein the horizontal correction signal will not be distorted when amplified by the amplifier since the horizontal correction signal is a continuous signal.

- 18. The circuit of Claim 17 further comprising a modulator operable to modulate an amplitude of a horizontal sawtooth signal using the horizontal correction signal.
 - 19. The circuit of Claim 17 further comprising:

M-11723 US 804312 vi

> a modulator operable to modulate an amplitude of a horizontal sawtooth signal using the horizontal correction signal to generate an amplitude modulated horizontal sawtooth signal; and

a horizontal deflection coil coupled to the receive the amplitude modulated horizontal sawtooth signal.

- 20. The circuit of Claim 17 wherein the circuit is implemented on a single integrated circuit.
- 21. A method for reducing east-west geometry mismatch between the top and bottom of a raster display, the method comprising generating a horizontal correction signal, wherein the horizontal correction signal is a continuous signal that will not be distorted when amplified.
- 22. The method of Claim 21 further comprising modulating an amplitude of a horizontal sawtooth signal using the horizontal correction signal.
 - 23. The method of Claim 21 further comprising:

generating a modulated horizontal sawtooth signal by modulating an amplitude of a horizontal sawtooth signal with the horizontal correction signal; and

providing the modulated horizontal sawtooth signal to horizontal deflection coil.

24. The method of Claim 21 wherein the method is performed on a single integrated circuit.
